Issue	Possible mitigation
Raw sql could be injected in one of fields	Implement validation on field
Invalid data could be provided while registration	Validate data from data
Database connection is exposed	Ensure that connection is over SSL
Security misconfiguration	Move connection string from env to key vault
User password can be reversed from hash	Use proper hash algorithm for password
Someone can get access to database	Configure roles with different level of access in database
Invalid query can corrupt data	Use SQL transactions to have an ability to rollback data.
